

P17469

AMENDMENT**Amendments to the Claims**

1(Original). A system, comprising:
a processor;
a nonvolatile mass storage device; and
a host control interface to couple the processor to the nonvolatile mass storage device and issue read/write commands to manage polarity.

2(Original). The system of claim 1 wherein the nonvolatile mass storage device is a disk cache.

3(Original). The system of claim 1 wherein the nonvolatile mass storage device has polymer memory devices.

4(Original). The system of claim 3 wherein the nonvolatile mass storage device having polymer memory devices is a disk cache.

5(Original). The system of claim 1 wherein polarity management ensures that data is stored in the nonvolatile mass storage device with a polarity opposite of that last used for a memory word.

6(Original). The system of claim 1 wherein polarity management includes an explicit polarity control with a polarity indicator to determine data polarity for each write.

7(Original). The system of claim 1 wherein polarity management includes a recovered polarity that uses a last polarity from a read operation for a subsequent write operation.

8(Original). The system of claim 1 wherein polarity management includes an automatic polarity where contents of a polarity map determine polarity on reads and polarity in the polarity map is toggled for writes.

P17469

9-14(Canceled).

15(Original). A system comprising:
a processor;
addressable mass storage devices; and
a host controller interface to couple processor commands to the
addressable mass storage devices and account for special handling needs of
polymer devices in the addressable mass storage devices.

16(Original). The system of claim 15 wherein the special handling
needs include reporting a number of error corrections.

17(Original). The system of claim 15 wherein the special handling
needs include using a polarity map to determine how polarity is to be handled
for a specific access.

18(Original). The system of claim 15 wherein the special handling
needs include using a timing control to specify on a per operation basis what
timing should be used for read/write operations.

19(Original). The system of claim 15 wherein the special handling
needs include using dynamic addressing to write data to a location in a
different segment from where the data was read in the addressable mass
storage devices.

20(Original). The system of claim 15 wherein the addressable mass
storage devices represent a disk cache having multiple cache storage devices.

21(Original). The system of claim 20 wherein the special handling
needs further include storing a minimum and a maximum cache line size and
metadata size.

P17469

22(Original). A system comprising:

a processor having a transceiver coupled to dual antennas; and
a memory module coupled to the processor and including,

(a) a memory controller,

(b) storage devices to form a mass storage that is coupled to
the memory controller, and

(c) a host controller coupled to the processor to provide a
refresh cycle issued through an interface to the storage devices.

23(Original). The system of claim 22 wherein the storage devices are
polymer memory devices.

24(Original). The system of claim 22 wherein the storage devices are
flash memory devices.

25(Original). The system of claim 22 wherein the memory module is a
bus master device that is given a list of commands to asynchronously process.

26(Original). The system of claim 25 wherein the list of commands are
processed without involvement by the processor.

27(Original). The system of claim 22 wherein data stored by the storage
devices on the memory module is not directly accessible by processor
instructions.

28(Original). The system of claim 27 wherein the data stored by the
storage devices on the memory module is copied to/from system memory.

P17469

29-32(Canceled).

33(Original). A method including functions in a host control interface to facilitate read/write operations in a mass storage to include at least one of:

- (a) providing a continuous associated command to allow a group of commands to be issued together,
- (b) using a polarity map to determine how polarity is to be handled for a specific access to the mass storage,
- (c) using a timing control to specify on a per operation basis what timings should be used for read/write operations,
- (d) using dynamic addressing to write data to a location in a different segment from where the data was read,
- (e) issuing a multi-command to allow different operations to multiple storage devices in the mass storage,
- (f) providing a refresh cycle,
- (g) recording a number of corrections applied to the mass storage, and
- (h) using a scatter gather list to correctly access data in the mass storage.

34(Original). The method of claim 33, wherein facilitating read/write operations in the mass storage includes using the mass storage having a ferroelectric polarizable material.

35(Original). The method of claim 33, wherein facilitating read/write operations in the mass storage includes using the mass storage having a resistive change polymer memory.

36(Original). The method of claim 33, wherein facilitating read/write operations in the mass storage further includes facilitating read/write operations in a polymer storage.

P17469

37(Original). The method of claim 33, wherein facilitating read/write operations in the mass storage further includes facilitating read/write operations in a disk cache.

~~39~~ 38(Currently amended). The method of claim 37 further includes storing a minimum and maximum cache line size and metadata size in the disk cache.

P17469

~~40~~ 39(Currently amended). A method of error reporting, comprising:
providing a periodic memory refresh cycle for storage devices; and
allowing a memory controller to detect an error and interrupt the
software controlling the storage devices to report a memory refresh failure.

~~44~~ 40(Currently amended). The method of claim ~~40~~ 39 further
including:
incorporating Polymer Ferroelectric Memory (PFEM) devices for the
storage devices.

~~42~~ 41(Currently amended). The method of claim ~~40~~ 39 wherein
providing the periodic memory refresh cycle for storage devices further includes
providing the periodic memory refresh cycle for cache storage devices.

P17469

~~43~~ 42(Currently amended). An article comprising a machine-readable storage medium containing instructions that if executed enable a host controller interface to control read/write operations for mass storage that include at least one of:

providing a continuous list of commands to allow a group of commands to be issued together;

using a polarity map to determine how polarity is to be handled for a specific access of the mass storage;

using a timing control to specify on a per operation basis what timing should be used for read/write operations;

using dynamic addressing to write data to a location in a different segment of the mass storage from where the data was read;

issuing a multi-command to allow different operations to multiple devices in the mass storage;

providing a refresh cycle; and

reporting a number of memory error corrections.

~~44~~ 43(Currently amended). The article of claim ~~43~~ 42 wherein the mass storage is a flash memory.

~~45~~ 44(Currently amended). The article of claim ~~43~~ 42 wherein the mass storage is a polymer storage.

~~46~~ 45(Currently amended). The article of claim ~~45~~ 44 wherein the polymer storage includes a ferroelectric polarizable material.

~~47~~ 46(Currently amended). The article of claim ~~45~~ 44 wherein the polymer storage includes a resistive change polymer memory.

~~48~~ 47(Currently amended). The article of claim ~~45~~ 44 wherein the mass storage is a disk cache.
